

## ABSTRACT

A replica in which a bone part and soft tissue are reproduced with physical properties close to those of real  
5 organs and tissues in term of shape, color, apparent  
textures, softness and hardness, and which allows a trainee  
to practice surgical techniques so that part of the replica  
can be incised by surgical manipulation, together with a  
production method for the replica. The bone part and soft  
10 tissue are reproduced with physical properties close to  
those of real tissue. The incisable part is replaceable as  
a component, whereas the body part of the replica can be  
used repeatedly.
